**Lecture Presentation**

**Chapter 4**

***Forces and Newton's Laws of Motion***

## Suggested Simulations for Chapter 4

- **PhETs**
  - *Forces in 1D*
  - *The Ramp*

## Chapter 4 Forces and Newton's Laws of Motion

**Chapter Goal:** To establish a connection between force and motion.

© 2015 Pearson Education, Inc.

Slide 4-3

## Chapter 4 Preview

### Looking Ahead: Forces

- A force is a push or a pull. It is an interaction between two objects, the **agent** (the woman) and the **object** (the car).

- In this chapter, you'll learn how to identify different forces, and you'll learn their properties.

© 2015 Pearson Education, Inc.

Slide 4-4

## Chapter 4 Preview

### Looking Ahead: Forces and Motion

- Acceleration is caused by forces. A forward acceleration of the sled requires a forward force.

- A larger acceleration requires a larger force. You'll learn this connection between force and motion, part of Newton's second law.

© 2015 Pearson Education, Inc.

Slide 4-5

## Chapter 4 Preview

### Looking Ahead: Reaction Forces

- The hammer exerts a downward force on the nail. Surprisingly, the nail exerts an equal force on the hammer, directed upward.

- You'll learn how to identify and reason with **action/reaction pairs** of forces.

Slide 4-6

## Chapter 4 Preview Looking Ahead

### Forces

A force is a push or a pull. It is an interaction between two objects, the **agent** (the woman) and the **object** (the car).

In this chapter, you'll learn how to identify different forces, and you'll learn their properties.

### Forces and Motion

Acceleration is caused by forces. A forward acceleration of the sled requires a forward force.

A larger acceleration requires a larger force. You'll learn this connection between force and motion, part of Newton's second law.

### Reaction Forces

The hammer exerts a downward force on the nail. Surprisingly, the nail exerts an equal force on the hammer, directed upward.

You'll learn how to identify and reason with **action/reaction pairs** of forces.

Text: p. 97

Slide 4-7

## Chapter 4 Preview Looking Back: Acceleration

- You learned in Chapters 2 and 3 that acceleration is a vector pointing in the direction of the change in velocity.
- If the velocity is changing, there is an acceleration. And so, as you'll learn in this chapter, there must be a net force.

© 2015 Pearson Education, Inc.

Slide 4-8

## Chapter 4 Preview

### Stop to Think

A swan is landing on an icy lake, sliding across the ice and gradually coming to a stop. As the swan slides, the direction of the acceleration is

- A. To the left.
- B. To the right.
- C. Upward.
- D. Downward.

Slide 4-9

## What Causes Motion?

- In the absence of friction, **if the sled is moving, it will stay in motion.**

© 2015 Pearson Education, Inc.

Slide 4-10

## What Causes Motion?

**Newton's first law** An object has no forces acting on it. If it is at rest, it will remain at rest. If it is moving, it will continue to move in a straight line at a constant speed.

© 2015 Pearson Education, Inc.

Slide 4-11

## What Is a Force?

- A **force** is a *push* or a *pull*.
- A **force** acts on an **object**.
- Every force has an **agent**, something that acts or pushes or pulls.

© 2015 Pearson Education, Inc.

Slide 4-12

## What Is a Force?

- A **force** is a *vector*. The general symbol for a force is the vector symbol  $\vec{F}$ . The size or strength of such a force is its magnitude  $F$ .
- **Contact forces** are forces that act on an object by touching it at a point of contact.
- **Long-range forces** are forces that act on an object without physical contact.

© 2015 Pearson Education, Inc.

Slide 4-13

## Force Vectors

**TACTICS BOX 4.1 Drawing force vectors**

- 1 Represent the object as a particle.
- 2 Place the *tail* of the force vector on the particle.
- 3 Draw the force vector as an arrow pointing in the direction that the force acts, and with a length proportional to the size of the force.
- 4 Give the vector an appropriate label.

Exercise 1

Text: p. 100

Slide 4-14

## Force Vectors

© 2015 Pearson Education, Inc.

Slide 4-15

## Combining Forces

- Experiments show that when several forces  $\vec{F}_1, \vec{F}_2, \vec{F}_3, \dots$  are exerted on an object, the combine to form a **net force** that is the *vector sum* of all the forces:

$$\vec{F}_{\text{net}} = \vec{F}_1 + \vec{F}_2 + \vec{F}_3 + \dots$$

- The net force is sometimes called the resultant force. It is not a new force. Instead, we should think of the original forces being *replaced* by  $\vec{F}_{\text{net}}$ .

© 2015 Pearson Education, Inc.

Slide 4-16

## Weight

- The gravitational pull of the earth on an object on or near the surface of the earth is called **weight**.
- The agent for the weight forces is the *entire earth* pulling on an object.
- **An object's weight vector always points vertically downward**, no matter how the object is moving.

© 2015 Pearson Education, Inc.

Slide 4-17

## Spring Force

(a) A compressed spring exerts a pushing force on an object.

(b) A stretched spring exerts a pulling force on an object.

- Springs come in in many forms. When deflected, they push or pull with a spring force.

© 2015 Pearson Education, Inc.

Slide 4-18

## Tension Force

- When a string or rope or wire pulls on an object, it exerts a contact force that we call the **tension force**.
- The **direction of the tension force is always in the direction of the string or rope**.

© 2015 Pearson Education, Inc.

Slide 4-19

## Normal Force

- The force exerted on an object that is pressing against a surface is in a direction *perpendicular* to the surface.
- The **normal force** is the force exerted by a surface (the agent) against an object that is pressing against the surface.

© 2015 Pearson Education, Inc.

Slide 4-20

## Normal Force

- The normal force is responsible for the “solidness” of solids.
- The symbol for the normal force is  $\vec{n}$ .

© 2015 Pearson Education, Inc.

Slide 4-21

## Friction

- Friction, like the normal force, is exerted by a surface.
- The frictional force is always parallel to the surface.
- *Kinetic friction*, denoted by  $\vec{f}_k$ , acts as an object slides across a surface. Kinetic friction is a force that always “opposes the motion.”
- *Static friction*, denoted by  $\vec{f}_s$ , is the force that keeps an object “stuck” on a surface and prevents its motion relative to the surface. Static friction points in the direction necessary to *prevent* motion.

© 2015 Pearson Education, Inc.

Slide 4-22

## Friction

The sled is moving to the right but it is slowing down . . .

The woman is pulling to the left, but the crate doesn't move . . .

© 2015 Pearson Education, Inc.

Slide 4-23

## Drag

- The force of a fluid (like air or water) on a moving object is called **drag**.
- Like kinetic friction, drag points opposite the direction of motion.
- **You can neglect air resistance in all problems unless a problem explicitly asks you to include it.**

Air resistance is a significant force on falling leaves. It points opposite the direction of motion.

© 2015 Pearson Education, Inc.

Slide 4-24

## Thrust

- **Thrust** is a force that occurs when a jet or rocket engine expels gas molecules at high speed.
- **Thrust is a force opposite the direction in which the exhaust gas is expelled.**

© 2015 Pearson Education, Inc.

Slide 4-25

## Identifying Forces

### TACTICS BOX 4.2 Identifying forces

- 1 Identify the object of interest. This is the object whose motion you wish to study.
- 2 Draw a picture of the situation. Show the object of interest and all other objects—such as ropes, springs, and surfaces—that touch it.
- 3 Draw a closed curve around the object. Only the object of interest is inside the curve; everything else is outside.
- 4 Locate every point on the boundary of this curve where other objects touch the object of interest. These are the points where *contact forces* are exerted on the object.
- 5 Name and label each contact force acting on the object. There is at least one force at each point of contact; there may be more than one. When necessary, use subscripts to distinguish forces of the same type.
- 6 Name and label each long-range force acting on the object. For now, the only long-range force is weight.

Exercises 4–8

Slide 4-26

## Identifying Forces

**TABLE 4.1** Common forces and their notation

Force	Notation
General force	$\vec{F}$
Weight	$\vec{w}$
Spring force	$\vec{F}_{\text{sp}}$
Tension	$\vec{T}$
Normal force	$\vec{n}$
Static friction	$\vec{f}_s$
Kinetic friction	$\vec{f}_k$
Drag	$\vec{D}$
Thrust	$\vec{F}_{\text{thrust}}$

© 2015 Pearson Education, Inc.

Slide 4-27

## What Do Forces Do?

- How does an object move when a force is exerted on it?

© 2015 Pearson Education, Inc.

Slide 4-28

## What Do Forces Do?

- As the block starts to move, in order to keep the pulling force constant you must *move your hand* in just the right way to keep the length of the rubber band—and thus the force—*constant*.

© 2015 Pearson Education, Inc.

Slide 4-29

## What Do Forces Do?

The experimental findings of the motion of objects acted on by constant forces are:

- **An object pulled with a constant force moves with a constant acceleration.**
- **Acceleration is directly proportional to force.**
- **Acceleration is *inversely proportional* to an object's mass.**

© 2015 Pearson Education, Inc.

Slide 4-30

## Newton's Second Law

- A force causes an object to accelerate.
- The acceleration  $a$  is directly proportional to the force  $F$  and inversely proportional to the mass  $m$ :

$$a = \frac{F}{m}$$

- The direction of the acceleration is the same as the direction of the force:

$$\vec{a} = \frac{\vec{F}}{m}$$

© 2015 Pearson Education, Inc.

Slide 4-31

## Newton's Second Law

**Newton's second law** An object of mass  $m$  subjected to forces  $\vec{F}_1, \vec{F}_2, \vec{F}_3, \dots$  will undergo an acceleration  $\vec{a}$  given by

$$\vec{a} = \frac{\vec{F}_{\text{net}}}{m}$$

where the net force  $\vec{F}_{\text{net}} = \vec{F}_1 + \vec{F}_2 + \vec{F}_3 + \dots$  is the vector sum of all forces acting on the object. **The acceleration vector  $\vec{a}$  points in the same direction as the net force vector  $\vec{F}_{\text{net}}$ .**

$$\vec{F}_{\text{net}} = m\vec{a}$$

© 2015 Pearson Education, Inc.

Slide 4-32

## Units of Force

$$1 \text{ basic unit of force} = (1 \text{ kg}) \times (1 \text{ m/s}^2) = 1 \frac{\text{kg} \cdot \text{m}}{\text{s}^2}$$

The basic unit of force is called a *newton*. One **newton** is the force that causes a 1 kg mass to accelerate at 1 m/s<sup>2</sup>.

$$1 \text{ pound} = 1 \text{ lb} = 4.45 \text{ N}$$

## Free-Body Diagrams

### TACTICS BOX 4.3 Drawing a free-body diagram

- 1 Identify all forces acting on the object. This step was described in Tactics Box 4.2.
- 2 Draw a coordinate system. Use the axes defined in your pictorial representation (Tactics Box 2.2). If those axes are tilted, for motion along an incline, then the axes of the free-body diagram should be similarly tilted.
- 3 Represent the object as a dot at the origin of the coordinate axes. This is the particle model.
- 4 Draw vectors representing each of the identified forces. This was described in Tactics Box 4.1. Be sure to label each force vector.
- 5 Draw and label the **net force vector**  $\vec{F}_{\text{net}}$ . Draw this vector beside the diagram, not on the particle. Then check that  $\vec{F}_{\text{net}}$  points in the same direction as the acceleration vector  $\vec{a}$  on your motion diagram. Or, if appropriate, write  $\vec{F}_{\text{net}} = \vec{0}$ .

Exercises 17–22

Text: p. 112

## Newton's Third Law

- Motion often involves two or more objects *interacting* with each other.
- As the hammer hits the nail, the nail pushes back on the hammer.
- A bat and a ball, your foot and a soccer ball, and the earth-moon system are other examples of interacting objects.

© 2015 Pearson Education, Inc.

Slide 4-35

## Interacting Objects

- An **interaction** is the mutual influence of two objects on each other.
- The pair of forces shown in the figure is called an **action/reaction pair**.
- An **action/reaction pair of forces exists as a pair, or not at all.**

© 2015 Pearson Education, Inc.

Slide 4-36

## Reasoning with Newton's Third Law

**Newton's third law** Every force occurs as one member of an action/reaction pair of forces.

- The two members of an action/reaction pair act on two *different* objects.
- The two members of an action/reaction pair point in *opposite* directions and are *equal* in magnitude.
